

## How To Add the HTML Player Code To A Wordpress Site

Example 1 shows how to add the HTML player code without a backend template editor and only uses the default editor for Wordpress.

Example 2 shows how to add the HTML player code with a backend template editor. Skip to page 5 for this example.

### Example 1: Using the default Wordpress Editor

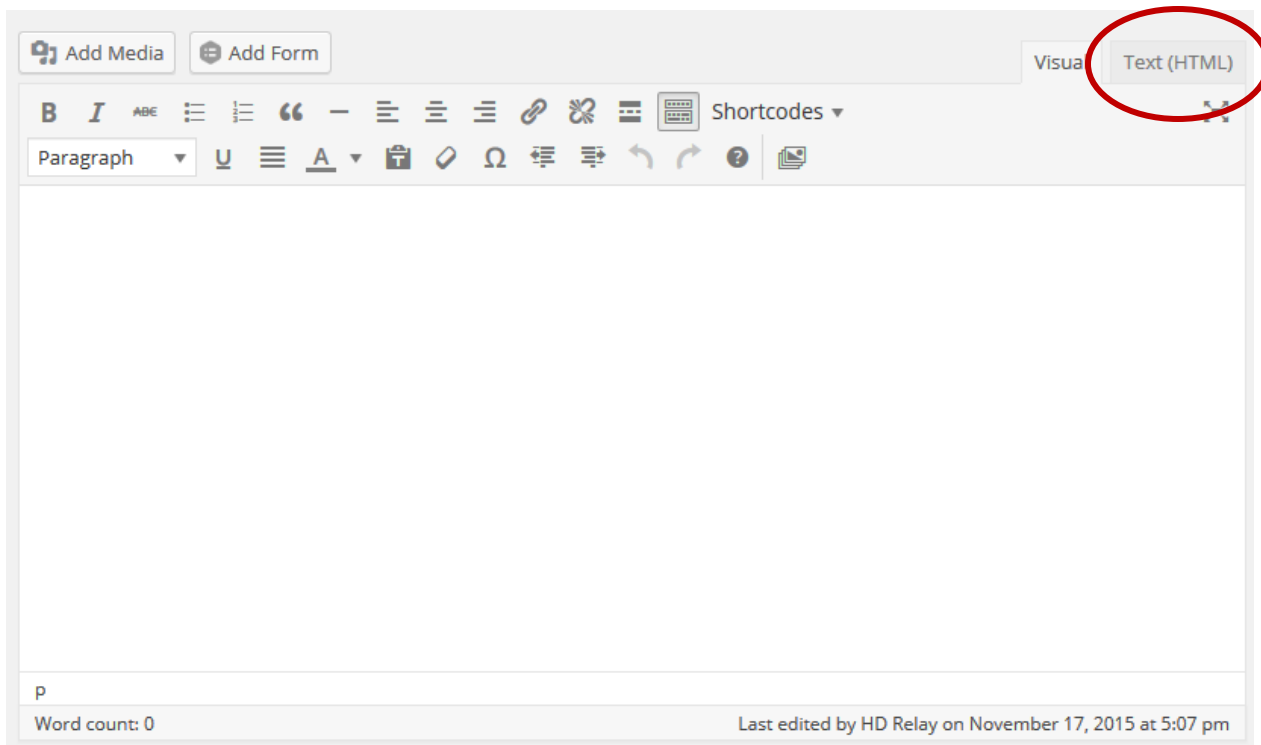

1) Login to your Wordpress website:

A screenshot of the WordPress login page. At the top center is the WordPress logo, a blue circle with a white 'W'. Below the logo is a white rectangular form with a light grey border. Inside the form, there are two text input fields: the first is labeled 'Username' and the second is labeled 'Password'. Below the password field is a checkbox labeled 'Remember Me'. To the right of the checkbox is a blue button with the text 'Log In' in white. At the bottom of the form, there is a link that says 'Lost your password?'.

2) Navigate to the post or page you would like the new HTML Player Code to be added and open/edit it:

3) Click on the tab called "Text (HTML)" to add the HTML code.

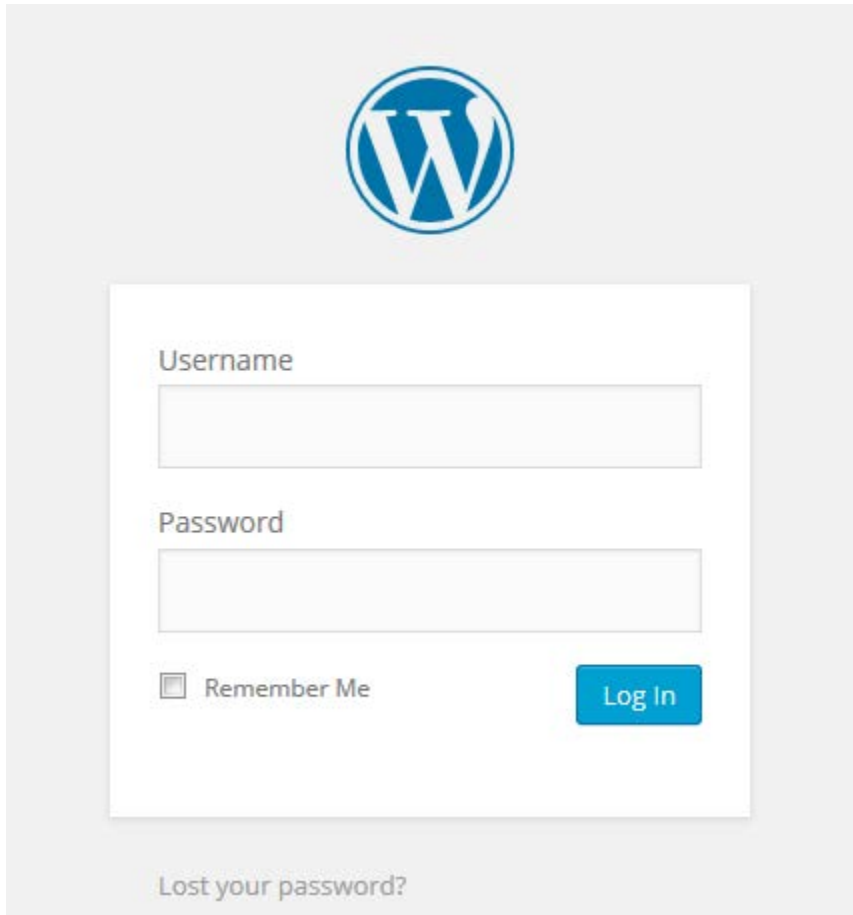

7) Navigate to the Wordpress post or page on your site and check to make sure your Live Stream is playing.

***Next section explains how to add the HTML player code with a backend template editor.***

## Example 2: Using the Wordpress Template/Backend Editor

1) Login to your Wordpress website:

The image shows the WordPress login interface. At the top center is the WordPress logo, a blue circle with a white 'W'. Below the logo is a white rectangular form with a light gray border. Inside the form, there are two input fields: the first is labeled 'Username' and the second is labeled 'Password'. Below the password field is a checkbox labeled 'Remember Me'. To the right of the checkbox is a blue button with the text 'Log In' in white. Below the form, centered, is the text 'Lost your password?'.

2) Navigate to the post or page you would like the new HTML Player Code to be added and open/edit it:

3) To use the Wordpress Template or Backend Editor make sure it is enabled for this post or page.

A) If the Backend Editor is not enabled click the “Backend Editor” to enable it.

B) If you see the button called “Classic Mode” then the Template/Backend Editor is enabled and ready for use.

4) Once the Template/Backend Editor is enabled click on a “Add” icon. The add icon will either be a plus sign or button that says something like “Add Element.”

From your list of available elements to add, find the one called something like “Raw HTML.”

5) When the “Raw HTML” elements opens so you can edit the content, remove/delete the default HTML code temporarily placed in the element.

The image shows a 'Raw HTML Settings' dialog box with two tabs: 'General' and 'Design Options'. The 'Raw HTML' section is active, displaying a text area with the default HTML code: `<p>I am raw html block.<br/>Click edit button to change this html</p>`. This code is circled in red. A 'Delete' button is positioned below the text area, with an arrow pointing to the code. Below the text area is a placeholder text: 'Enter your HTML content.' Underneath is an 'Extra class name' field. At the bottom of the dialog are 'Close' and 'Save changes' buttons.

6) Open your email and copy the HTML code circled below.

Here are the player HTML codes:

Default Player:

```
<!-- Required libraries to be included preferentially in page head. -->
<script src="//ajax.googleapis.com/ajax/libs/swfobject/2.2/swfobject.js"></script>
<script src="//manage.hdrelay.com/js/hdrelay.js" type="text/javascript"></script>

<!-- Div that is going to hold web player. Size set to keep player space before load. -->
<div style="width: 800px; height: 480px;" id="webcam_holder"></div>

<!-- Code to show web player. Must go after div tag. -->
<script type="text/javascript">
  HDRelay.create({target:'webcam_holder',id:'539444e1-33e4-4102-9000-0000000000003'});
</script>
```

***This space left blank intentionally.***

7) Paste the HTML code into the “Raw HTML” element area.

![Screenshot of the 'Raw HTML Settings' dialog box. The 'General' tab is selected. The 'Raw HTML' section contains a text area with the following code: <!-- Required libraries to be included preferentially in page head. --> <script src=](//manage.hdrelay.com/js/hdrelay.js)

Raw HTML Settings

General Design Options

**Raw HTML**

```
<!-- Required libraries to be included preferentially in page head. -->
<script src="//ajax.googleapis.com/ajax/libs/swfobject/2.2/swfobject.js"></script>
<script src="//manage.hdrelay.com/js/hdrelay.js" type="text/javascript"></script>

<!-- Div that is going to hold web player. Size set to keep player space before load.
-->
<div style="width: 800px; height: 480px;" id="webcam_holder"></div>

<!-- Code to show web player. Must go after div tag. -->
<script type="text/javascript">
HDRelay.create({target: 'webcam_holder', id: 'XXXXXXXXXXXXXXXXXXXXXXXXXXXX'});
</script>
```

Enter your HTML content.

**Extra class name**

Style particular content element differently - add a class name and refer to it in custom CSS.

Close Save changes

8) Click the “Save changes” to save your changes/updates.

9) Click the “Update” or “Publish” button on your post or page to save/publish these changes.

10) Navigate to the Wordpress post or page on your site and check to make sure your Live Stream is playing.
